Patent No. 6414221

GENERAL INFORMATION:
APPLICANT: Obtiker, Juerg H.
APPLICANT: Shiu, Oi Yin
APPLICANT: Yang, Shang Fa
APPLICANT: Tip, Win Kin
APPLICANT: The Regents of the University of California
APPLICANT: The Regents of the University of Inducible Plant Promoters
FILE OF INVENTION: Transiently Activated Stress-Inducible Plant Promoters
FILE REFERENCE: 023070-097000US
CURRENT APPLICATION NUMBER: US/09/363,243
CURRENT FILING DATE: 1999-07-28
NUMBER OF SEQ ID NOS: 16

Sequence 17067, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THER
PILE REPERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT PILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR FILING DATE: 2000-10-03

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOPTWARE: FastSEQ for Windows Version 4.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of a tomato polygalacturonase genomic DNA clone isolated from a genomic library by screening with polygalacturonase colone isolated from a genomic library by screening with polygalacturonase breaker through red fruit stage in tomato fruit, and can be used in a novel method of the invention for producing a plant with an altered phenotype. In this method, regulatory regions from genes expressed during a particular developmental stage or in a specific tissue are identified by cDNA screening. The regulatory regions are manipulated for use with treansformed plants having a phenotypic property that can be modulated. The invention is exemplified with light, seed and fruit-specific promoters. Transformation without gall formation of cells which are not Agrobacterium hosts, especially cereals and legumes, is achieved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

This is the nucleotide sequence of a tomato polygalacturonase genomic DNA CC clone isolated from a genomic library by screening with polygalacturonase CC cDNA. The polygalacturonase gene promoter is active in at least the CC breaker through red fruit stage in tomato fruit, and can be used in a CC novel method of the invention for producing a plant with a regulatable CC phenotype. In this method, regulatory regions from plant genes (and T-DNA CC and Ti or Ri plasmids) are manipulated for use with foreign sequences for introduction into plant cells to provide transformed plants having a CC phenotypic property that can be modulated. The invention is exemplified CC with light, seed and fruit-specific promoters. Also claimed are methods CC for altering the phenotype of fruit tissue as distinct from other plant CC tissue, modifying the genotype of a plant to impart a desired CC characteristic to fruit, modifying transcription in fruit tissue, and CC expressing a heterologous DNA sequence of interest specifically in fruit clisue. The method provides transformation without gall formation in CC plants which have historically not been Agrobacterium hosts. (Updated on CC 25-MAR-2003 to correct PR field.)

The constructs can be used for the expression of heterologous genes in plants. They can be used for modifying the phenotype of plants. The DNA sequence of interest may encode an enzyme or may comprise an antisense sequence. The constructs can be used in plants such as soybean, rapeseed, cotton, safflower or sunflower. The present sequence represents the polygalacturonase genomic clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Local Similarity

The method is useful for obtaining plants having modified phenotype or for altering the phenotype of a plant seed or tissue. The DNA constructs are used in manipulating plant cells to provide for regulated transcription, such as light inducible transcription, in a plant tissue or plant part of interest at particular stages of plant growth or in response to external control. These constructs are also used for modulation of expression of endogenous products as well as production of exogenous products in the seed. The present sequence represents the nucleotide sequence of polygalacturonase (PG) genomic clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

Example 15; Fig 8; 68pp; English.

CC protein (ACP) gene, e.g. a mapin gene, an kay gene or an acyl carrier CC protein (ACP) gene, a DNA sequence of interest other than the native CC coding sequence of the gene and a transcription termination region, where the components are functional in a plant cell and where the DNA construct is flanked by T-DNA. Also included are a plant cell having an altered CC ghant, obtaining a plant in a plant cell having an altered CC comprising cells comprising a DNA construct, a seed obtained from the CC glant, obtaining a plant taving a modified phenotype or modifying the CC distinct from other plant tissue, altering the phenotype of plant seed clistuc or modifying transcription in seed tissue as distinct from other plant tissue and selectively expressing a heterologous DNA sequence of CC interest in seed tissue as distinct from other plant tissue. The DNA CC construct is useful in modifying or altering the genotype or phenotype of plant to impart a desired characteristic. The construct is also useful CC in regulating genetic modification of plant or regulating tissue and/or developmental specific transcription and expression in plants. The plants correct, enhanced response to light and dehydration resistance and CC the Napin, ACP and EA9 genes and the fruit specific promoter is from the CC tomato 2A11 gene. The present sequence is the tomato polygalacturonase CC gene used in the transgenic constructs. The invention relates to a DNA construct comprising, as operably linked components in the direction of transcription, a promoter region obtainable from a gene, e.g. a napin gene, an EA9 gene or an acyl carrier protein (ACP) gene, a DNA sequence of interest other than the native

```

The polygalacturonase genomic clone may be inserted into a fruit specific DNA construct containing the transcription initiation region 2All. The constructs allow modification of plant phenotypes during fruit maturation and ripening. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated PR field.)

```

Recombinant DNA for flowering and fruiting plants e.g. tomatoes ripo control - comprises base sequence for transcription contg. inverted sequence of bases complementary to bases in anti sense ribonucleic sequence of bases complementary to bases in anti sense ribonucleic sequences as some sequences. tomatoes ripening

Example 12; Fig 1; 20pp; English.

This is the sequence of clone pTOM6 which contains the coding sequence polygalacturonase (PG). It was used to isolate the PG promoter in the construction of a vector encoding antisense RNA to the PG cDNA and PG gene. This would be useful to regulate the expression of the fruit softening enzymes in flowering and fruiting plants. Such antisense RNA would delay fruit softening. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct OS field.) 2003 to correct PA field.) (Updated on 25-MAR-2003 to correct OS field.) of.

Modifying pectin, for foodstuffs preparation, involves transforming host having pectin methylesterase (PME) and polygalacturonase (PG) activity by silencing PG activity, to increase PME to PG ratio.

Claim 6; Fig 1; 78pp; English.

The invention provides a new method for modifying pectin that involves CC providing a host having pectin methylesterase (PME) activity and providing a host having pectin methylesterase (PME) activity and CC polygalacturonase (PG) activity, transforming the host by silencing PG activity to provide an increased PME to PG ratio, preparing a PME extract from the transformed host, and using the PME extract to modify pectin. A CC PME modified pectin is useful for foodstuffs preparation, and to impart CC in increased functionality to food products such as yogurt, milk/fruit complete and whey drinks PME is useful to reduce the number of ester groups in a pectin in a block-wise manner, and to de-esterify two or more CC adjacent galacturonic acid residue of a pectin on at least substantially confident galacturonic acid residue of a pectin on at least substantially confident galacturonic acid residue of a pectin on at least substantially confidence of pTOM6 encoding a PG enzyme. A nucleotide sequence (seq Id No. 3) encoding the PG enzyme which is deposited as pTOM23 with NCIMB CC (Accession number 12373) is also claimed. The sequence for seq ID No. 3 or the provided in the specification

The inverted sequence and the PG mRNA form double-stranded structure which inhibits expression of the PG mRNA. See also AAN80488. (Updated on 25-MAR-2003 to correct PA field.)

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a combject. The method comprises contacting a target nucleic acid in a complete between methylated and non-methylated acid in a complete within the target nucleic acid. ABZ09861 to ABZ11118 compresent specifically claimed nucleotide sequences from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative confiderative disorder haematopoietic cells; for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute application of the cytosine methylation state and/or single nucleotide collymorphisms (SNPs) of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Berlin olek A,
                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABZ10246 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-OCT-2002

                                                                                                                                                                                                                                                        The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders consecutive distributions in a subject. The method comprises contacting a target nucleic acid in: a complete. The method comprises contacting a target nucleic acid in: a complete. The method comprises contacting a target nucleic acid in: a complete which distinguishes between methylated and non-methylated 3pd contacting a target nucleic acid. ARZ09861 to ARZ1118 comprises the present specifically claimed nucleotide sequences from the present convention. Oligonucleotides from the present invention can be used; for differentiating between healthy haematopoietic cells and proliferative convention. Oligonucleotides from the present invention can be used; for disorder haematopoietic cells; for differentiating between acute of lymphocytic leukaemia and acute myelogenous leukaemia, as probes for conventioning the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder convention can be used for detecting a predisposition to, differentiation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between accompletic cell proliferation between a subclassed, diagnosis, prognosis, treatment and/or monitoring of convention can be used for detecting a predisposition to, differentiation between accompletic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                CC This is the nucleotide sequence of the tomato Mi locus associated with CC nematode resistance, obtained from a bacterial artificial chromosome CC (BAC). Mi was localised by genetic analysis to a region of the tomato CC genome of about 65 kb. DNA corresponding to this region was cloned into CC genome of about 65 kb. DNA corresponding to this region was cloned into CC reading frames, one of which is probably a pseudogene. By RNA blot CC canalysis, transcripts of approximately 4 kb corresponding to copy 1 and CC copy 2 were found in both resistant and susceptible tomato roots and in CC leaves of resistant but not susceptible plants. CDNA sequences CC corresponding to full-length transcripts of copy 1 (see. AAV26082) and CC copy 2 (see AAV26083) were obtained. The encoded polypeptides (see CC AAW55974-75) are 91% identical and contain structural features similar to CC known plant resistance genes (R genes) of the nucleotide binding site/CC leucine-rich repeat (NBS/LRR) family. A recombinant expression cassette CC comprising an Mi polynucleotide and an operably linked plant promoter can CC used to enhance nematode resistance in plants especially tomatoes (C claimed). Transgenic plants can also be constructed using a Mi promoter CC with heterologous genes; the Mi promoters can be used to express a contain the registerance same temporal and spatial patterns and at similar contains and a similar contains and a sequences.
